Objective

To develop and evaluate an in-house .NET/C# Eclipse Scripting API (ESAPI) solution with a dynamic universal graphical user interface (UGUI) to automate optimization-structure creation across disease sites and reduce treatment planning time.

Methods

- ❑ A generalized C# framework was developed in Microsoft Visual Studio using ESAPI within Eclipse TPS v18.1.
- ❑ The UGUI dynamically adapts to user-defined inputs, including the number of targets and organs at risk (OARs), ring parameters, cropping limits, and selected dose levels.
- ❑ Two workflow-specific modules were implemented: (1) simultaneous integrated boost (SIB) and (2) sequential planning. Scripts were tested in a non-clinical Eclipse environment and validated using anonymized patient datasets from multiple treatment sites, including prostate, breast, head and neck, and brain.
- ❑ Efficiency was quantified by comparing the time required for manual optimization-structure creation versus the automated scripting workflow.

Results

- ❑ For both SIB and sequential workflows, the UGUI guides users through selecting targets/OARs and entering standardized margins (e.g., PTV-to-ring spacing and OAR exclusion/cropping distances).
- ❑ The script then automatically generates planning rings and OAR optimization helper structures by cropping OAR volumes away from the target volumes using user-defined distances.
- ❑ For SIB planning, the tool supports multiple PTVs with user-specified dose levels and creates dose-priority cropping and per-PTV ring structures.
- ❑ For sequential workflows, the tool supports single-target prescriptions with the same automated ring and OAR-cropping logic. Across disease sites, the script standardized optimization-structure generation and substantially reduced manual contouring effort, decreasing mean $\pm$ SD creation time from 18.75 ± 5.03 minutes (manual) to 1.13 ± 0.29 minutes (automated).

Conclusions

- ❑ This in-house, department-developed ESAPI automation framework delivers a scalable, disease-site-independent method for optimization-structure generation and substantially improves planning efficiency.
- ❑ The work demonstrates the impact of internally developed clinical automation to standardize workflows and reduce repetitive planning tasks within the department.

Results

Custom Rings & PTV/OAR Helper (Dose-priority cropping + per-PTV rings)

SIB opti creation Sequential opti creation

Select the Body: BODY

Select the number of PTVs: 3

Select the OARs (count): 4

Crop of exclude OARs (mm): 3

Select Number of Rings (Total): 3

Ring widths (cm) e.g. 1,1,1 or 1,2,3: 1,1,1

Crop distance from PTV to Ring (mm): 3

Inter-PTV crop (mm) (lower dose cropped by high): 3

PTVs (pick & enter dose in Gy)

Select PTV1: PTV_7000 Dose for PTV1 (Gy): 70

Select PTV2: PTV_6300 Dose for PTV2 (Gy): 63

Select PTV3: PTV_5600 Dose for PTV3 (Gy): 56

OARs

Select OAR1 (or N/A): Cavity_Oral

Select OAR2 (or N/A): Parotid_R

Select OAR3 (or N/A): Parotid_L

Select OAR4 (or N/A): Larynx

Generate Selectors Create

Figure 1: Universal graphical user interface (UGUI) for the SIB planning workflow developed using the Eclipse Scripting API (ESAPI).
